

Developing a system for provisional assessments of excavation materials volumes through semi-automated tools and 2D/3D modelling interfaces in an urban context

Applications of the GeoQuat project

Development:
Presented by:
In collaboration with:

Michael Gaehwiler
Nicolas Clerc,
Swisstopo; AlterEgo; Bricks Development West AG

Presentation outline

Introduction: the GeoQuat project and its motivations

The GeoQuat Geneva pilot

- 3D Models
- Derived products and applications

Specific application case on a polluted construction site

- Environmental 3D model
- Pollution volume and associated cost assessment
- Optimization tool

Conclusions

Quaternary deposits

- Mostly glacial or Interglacial origin
- Varying thicknesses
- Highly heterogeneous
- Complex geometries

In Switzerland, ~ 90% of the underground needs and infrastructures are concentrated within these unconsolidated deposits

Resources, constraints and challenges

Constructions and management of excavation material

Mineral resources

Groundwater resources

Shallow geothermal systems

Etc...

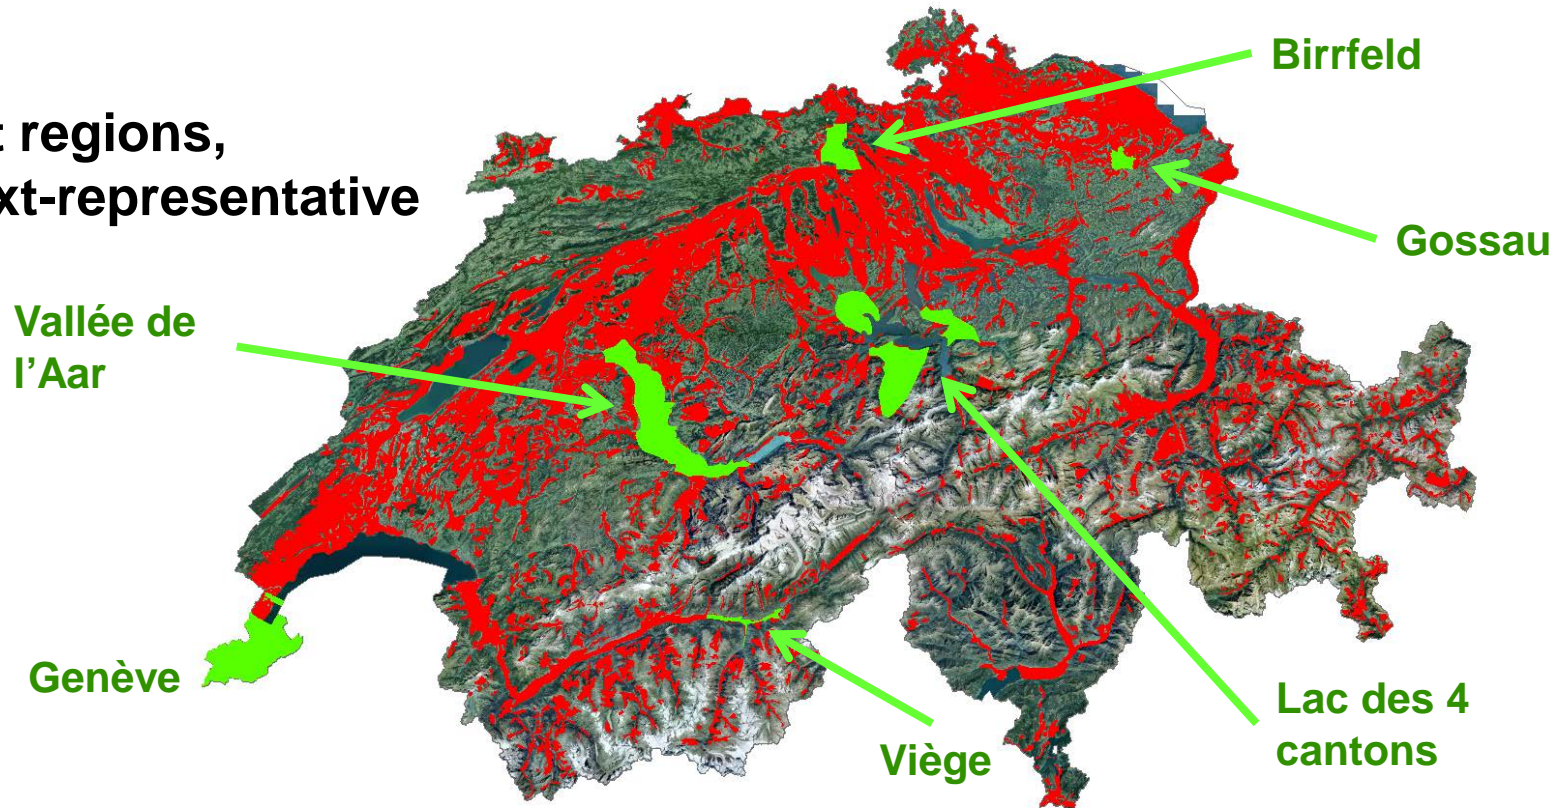

Pollution

- Large variety of use, constraints and impacts
- **Conflicts** of use are unavoidable
- Necessity of **planning and coordination**

The "GeoQuat" project

- Develop robust and structured quaternary data models.
- Demonstrate the valorization potential of structured data through:
 - The development of 3D geological and parametric models, as well as derived products
 - The use of 3D spatial requests for data consultation
- Develop "transparent" & well-documented automated workflows

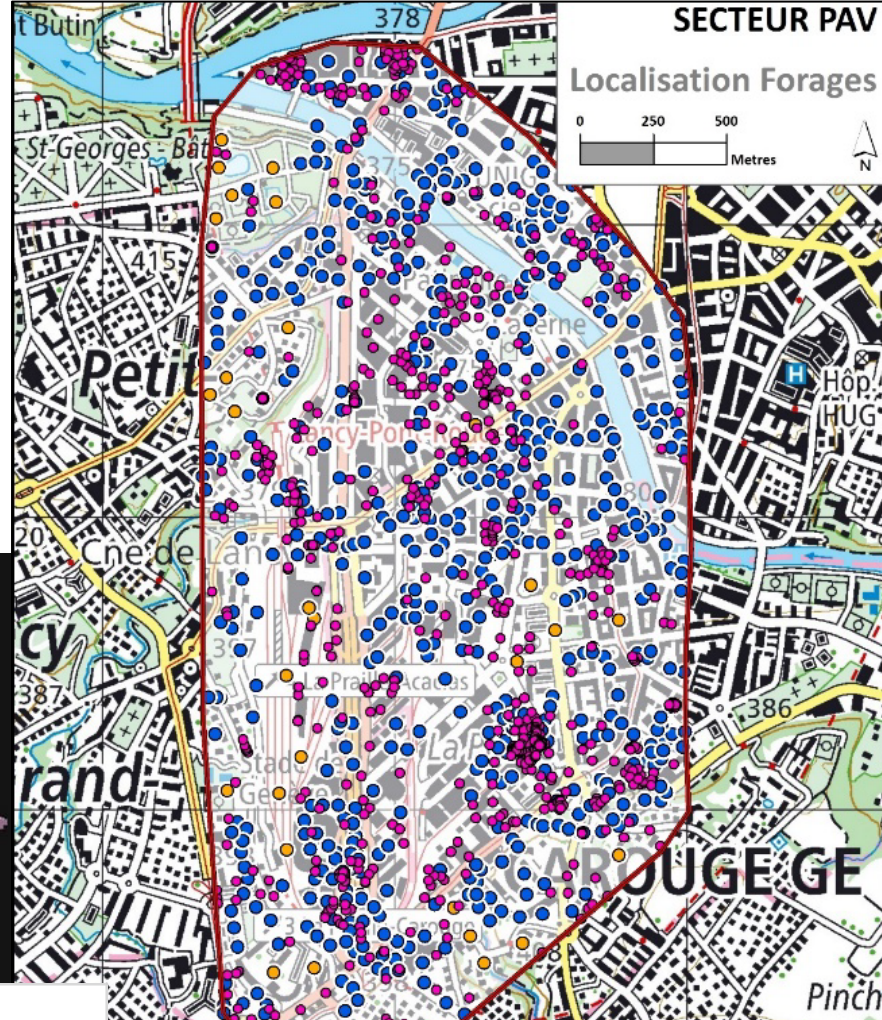

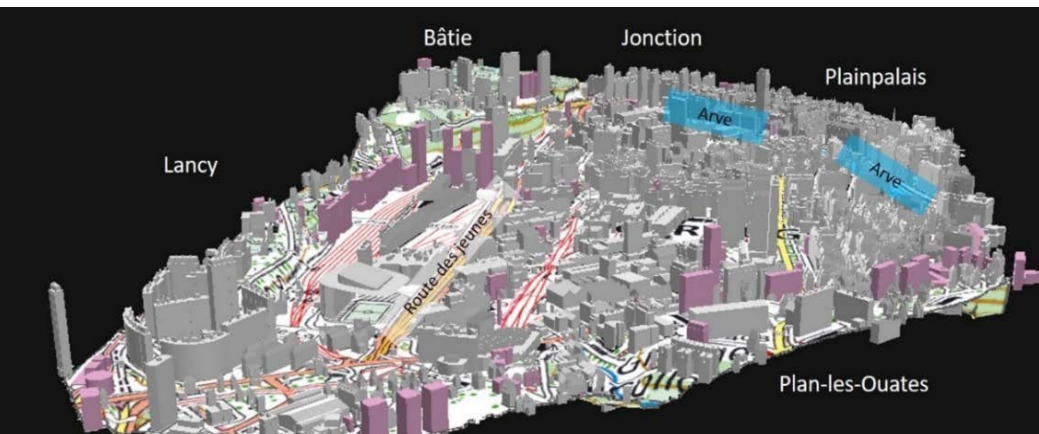

**6 pilot regions,
context-representative**

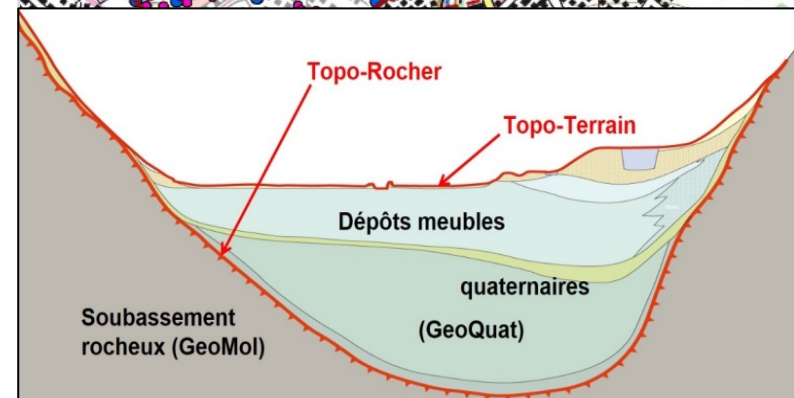

The GeoQuat Geneva pilot

Applied in **dense urban context** with:

- Important development planned
- Urban-specific needs and problematics
- High density of data (> 600 wells used)
- Investigation area: 5km²

PROFONDEURS DES FORAGES [MÈTRES]

Data preparation workflow

[illegible]

Re-interpretation of geological and geotechnical log data

Extraction toward structured data model

Important step, time consuming!

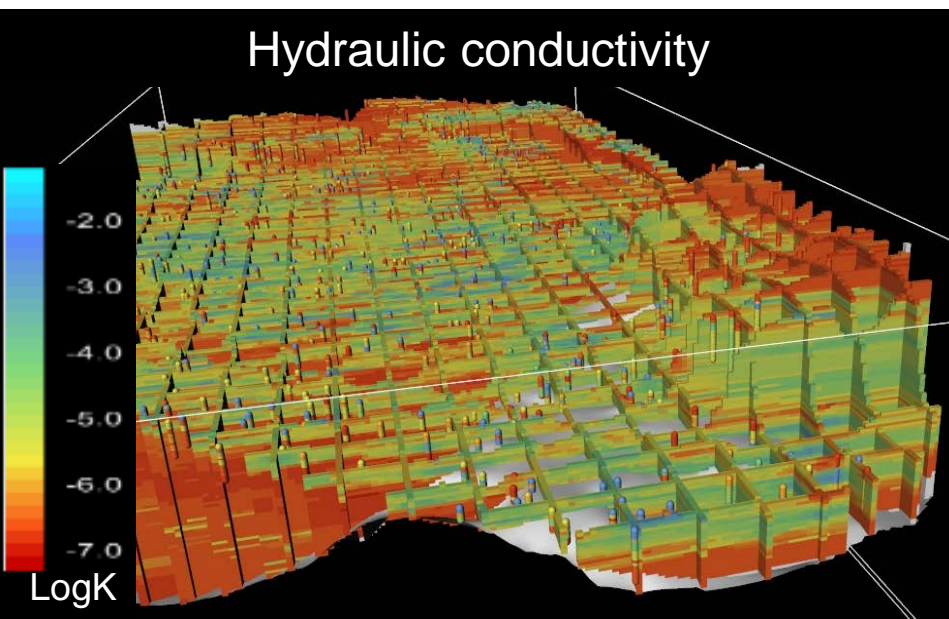

- *Grain size*
- *Grain distribution (for coarse phases)*
- *Plasticity (for fine mineral phases)*
- *OM content*

3D products

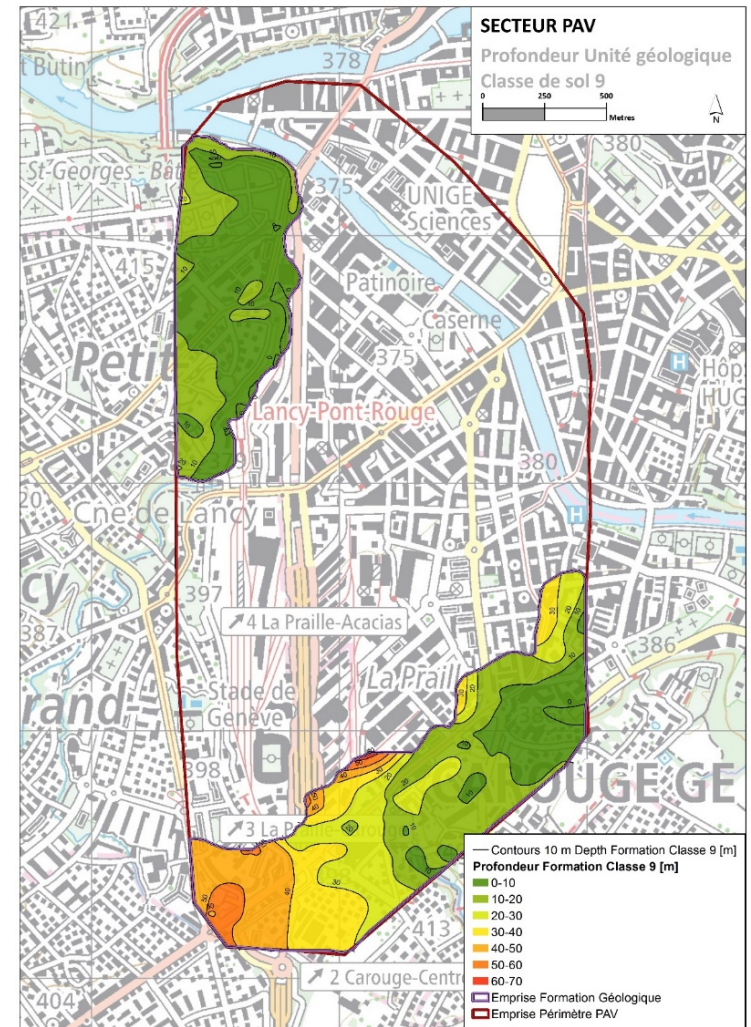

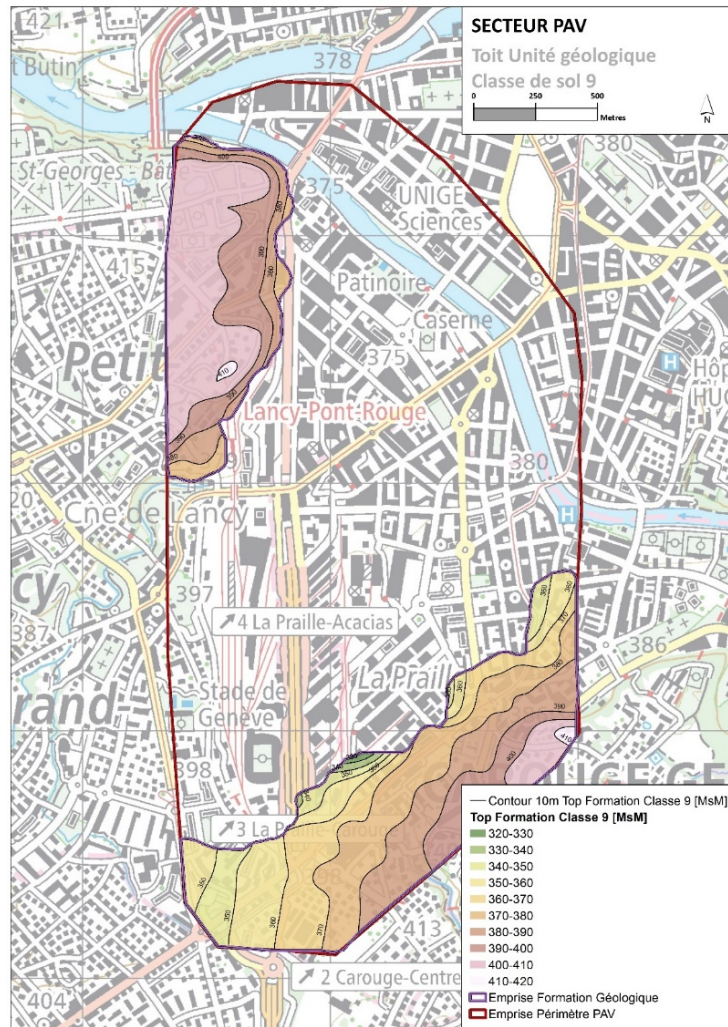

Parametric models (from USCS)

2D/3D products

- depth, elevation and thickness maps per geological units -

Complexe de la Molasse rouge du Châlon inférieur

Co-interpretation

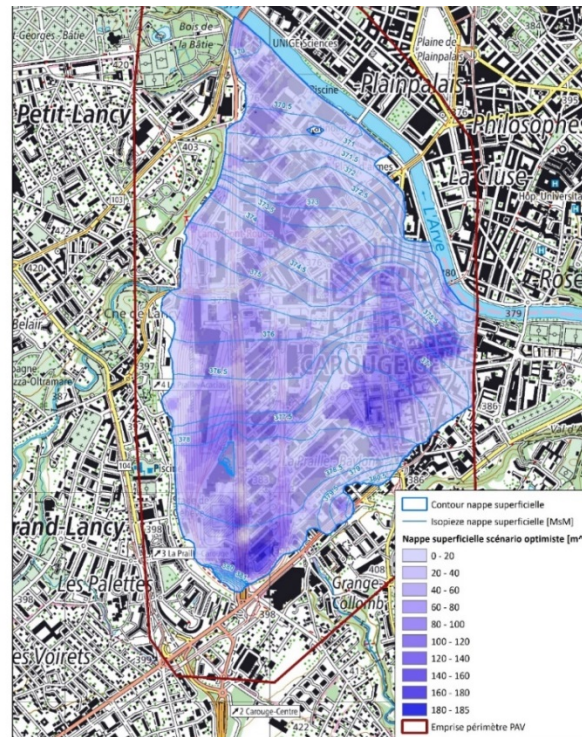

2D/3D products

- Applications from hydraulic conductivity model -

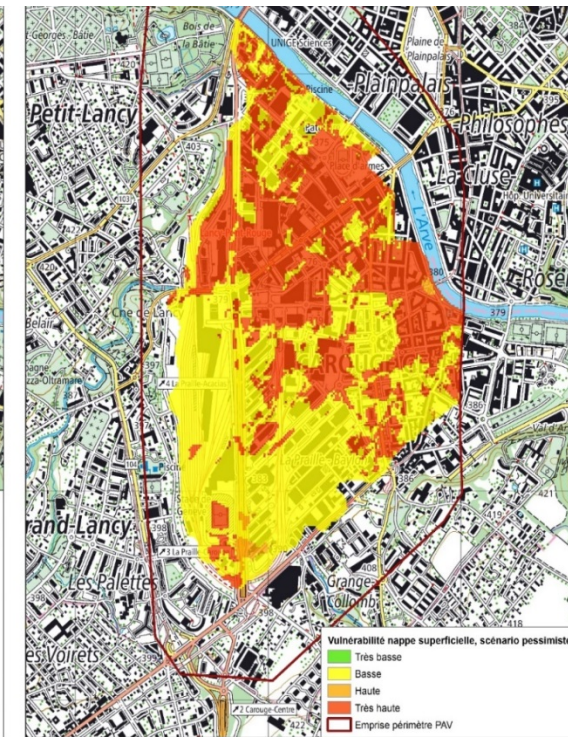

K-model + water table level

Groundwater volumes

Groundwater vulnerability

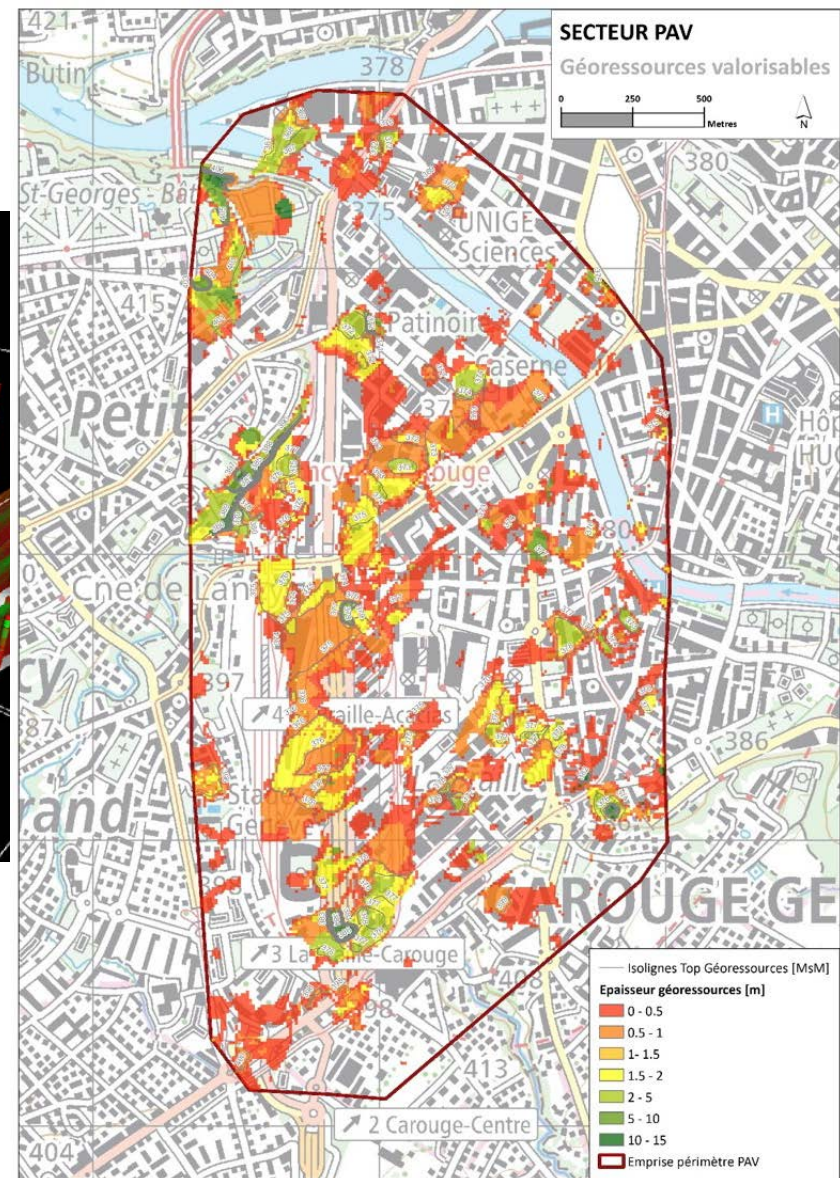

Swiss hydrogeological atlas standards and recommendations

2D/3D products

- Georesource quality -

Extraction of good quality sediments thickness within the first 15m.

2D/3D products

- Volume prediction for valorization of excavation materials -

Following cantonal guidelines

APPLICATIONS

1	Remblayage tranchées de collecteurs	utilisation brute
2	Couche de fondation	utilisation brute, éventuellement criblage
3	Couche de forme infrastructure routière	utilisation brute, éventuellement criblage
4	Etanchement	inadaptée
5	Surélévation terrain	utilisation brute
6	Matériaux de construction	utilisation après criblage, éventuellement brute
7	Remblayage contre ouvrages	utilisation brute
8	Drainage	utilisation après criblage, éventuellement brute
9	Digue ou remblais pour infrastructure routière	utilisation brute
10	Modelage paysager avec renforcement	utilisation brute
11	Modelage paysager sans renforcement	utilisation brute

Application case on polluted site

- Diagnostic and cost-optimization tool for a construction project -

- Pollution: **heavy metals; HCV; PCB; BTEX; HPT; HAP**
- Former industrial activity
- Size of the plot $\sim 15'000\text{m}^2$
- Realization of a higher-resolution environmental model
- Nb of wells 79
- Nb of samples 281
- 5 pollution status defined

Conclusions

- This method offers a large pannel of applications, derived products and decision tool in support of both:
 - The authorities in their role of sustainable planning and management of the subsurface and its resources.
 - The construction project managers and architects in the planning of treatment or valorization of excavation material.
- Robust data model and transparent, semi-automated, workflows allow repeatable results, as well as controlled and relatively fast update of the models.
- Data collection and re-interpretation, although most important, remains a laborious and time consuming task and must be realized by experienced people.
- Models remain predictive and carry a certain amount of uncertainty related to:
 - The data quality and spatial distribution
 - The construction of the model (choice of interpolation methods)
- This "demo" tool can be further developped and refined (and should be, step by step, extended to the rest of the territory, toward a complete 3D management persepective of the subsurface, which is of particular interest in densly urbanized regions.

Thank you
